

LinkedIn Job Trend Analysis

1. Introduction

The LinkedIn Job Trend Analysis project is an interactive Power BI dashboard created to analyze job-market information. It provides a clear view of job opportunities based on roles, cities, companies, skills, salary, experience level, and work type. The dashboard helps users identify employment trends and compare different aspects of the job market.

2. Abstract

This project transforms LinkedIn job data into meaningful visual insights using Power BI. The dashboard contains KPI cards for total jobs, total salary, average salary, number of companies, and highest salary. Charts analyze salary by role and experience level, job counts by city, skill, company, and work type, along with a geographical map of job locations. Interactive filters for Job ID, City, Company, Job Title, Role, Skill, and Work Type allow users to explore specific job segments.

3. Tools Used

Tool / Technology	Purpose
Power BI Desktop	Dashboard development and interactive visualizations
Power Query	Data cleaning and transformation
DAX	Calculated measures and KPI analysis
Excel / CSV	Job-market dataset and source data

4. Steps Involved in Building the Project

- Collected the LinkedIn job dataset and loaded it into Power BI.
- Cleaned and transformed the data in Power Query by checking data types, missing values, duplicates, and consistency.
- Prepared the data model and created required calculated measures using DAX.
- Created KPI cards showing total jobs, total salary, average salary, companies, and highest salary.
- Built visualizations for salary by role, job count by city, experience level, skill, company, and work type.
- Added a map to display the geographical distribution of jobs across cities.
- Added slicers for Job ID, City, Company, Job Title, Role, Skill, and Work Type.
- Formatted the dashboard with a consistent LinkedIn-inspired theme and tested all filters and visuals.

5. Conclusion

The LinkedIn Job Trend Analysis dashboard provides an effective way to understand job-market patterns. It helps compare salaries, identify cities with more opportunities, examine in-demand skills, and understand work-type and experience-level trends. The project demonstrates practical skills in Power BI, Power Query, DAX, data visualization, and business-oriented data analysis.
